- SMART Board® interactive whiteboard
- SMART Notebook™ collaborative learning software
- SMART Response™ interactive response system
- SMART Table® interactive learning center
- SMART Sync™ classroom management software

# Make learning accessible for all

**SMART products offering social and communication support**

SMART products naturally encourage collaboration in whole- and small-group activities. They offer students the opportunity to work toward curricular goals while practicing social skills alongside their peers. Our products can also be paired with many assistive technologies, making them ideal for students in inclusive learning environments. Learn more about SMART products that offer support for students with social or communication goals.

**SMART Board interactive whiteboard**

The SMART Board interactive whiteboard gives students a large interactive work surface that lends itself to whole- and small-group instruction. Combining multimedia content with hands-on learning experiences is proven to engage students of all learning styles. Even the most reticent students find the SMART Board interactive whiteboard so compelling that the desire to participate outweighs the fear of participating. The interactive whiteboard can also be paired with assistive technologies, such as dynamic and static speech-generating devices.

## SMART Notebook collaborative learning software

With SMART Notebook software, it's easy to create dynamic, interactive lessons that compel students to participate. You can use SMART Notebook to

- Create myriad activities that facilitate communication and socialization. For example, you can place pictures of students' faces on a digital dice, and then roll the dice to help students learn their peers' names.
- Offer opportunities to model social behavior, such as taking turns, initiating conversations and sharing ideas
- Help students improve their social skills. Have students make videos of themselves in social situations and then use SMART Video Player to show the videos. Students can stop and start the videos where needed to better understand social cues and their own responses to others.
- Incorporate assistive technologies, such as switch-accessible software. By using a transparent background, you can layer SMART Notebook lessons over switch-accessible programs, allowing switch users to participate in the same lesson alongside their peers.

## SMART Response interactive response systems

SMART Response interactive response systems include powerful assessment software that helps you deliver formative and summative assessments using a variety of question styles. Students answer questions using a wireless remote (or clicker).

With SMART Response, you can

- Increase student engagement by using SMART Response as a voting tool during group discussions and debates
- Assign SMART Response question sets as group work or encourage students to develop their own questions and deliver them to their peers
- Provide a safe, anonymous environment for students to communicate their understanding of lesson materials

## SMART Table interactive learning center

SMART Table offers a multitouch, multiuser learning experience where collaboration and communication happen naturally. With SMART Table, you can

- Encourage collaboration by having students work together on activities
- Have students observe peers modeling an activity before taking a turn of their own
- Encourage students to participate in activities alongside peers who may have different learning styles. Each quadrant of SMART Table can be customized for a particular student or skill set.
- Offer students multiple means of expression by designing lessons where they can answer with text, handwriting or pictures
- Offer opportunities for students to model taking turns, initiating conversations and sharing ideas
- Help students practice impulse control by working in a collaborative setting

## SMART Sync classroom management software

SMART Sync classroom management software connects your computer with those of your students. It's ideal for inclusive learning environments because it enables all students to work side-by-side on their computers, including students who require assistive technologies. You can use SMART Sync to

- Promote group work and discussion among students
- Enable students to take control of lessons with the *Pass the Chalk* feature
- Share ongoing work by broadcasting it on the SMART Board interactive whiteboard or on students' own computer screens – even across schools, cities and countries
- Incorporate assistive technologies. Students can participate in lessons alongside peers, responding from their voice output devices and computers.
