- SMART Notebook™ collaborative learning software
- SMART Board® interactive whiteboard
- SMART Response™ interactive response system
- SMART Table® interactive learning center
- SMART Document Camera™
- SMART Sync™ classroom management software

Make learning accessible for all

SMART products offering visual support

Guided by Universal Design for Learning principles, SMART solutions provide multiple ways for teachers and their students to represent and express information. And they make it easy for students to engage with instruction. Our products work with many assistive technologies and help teachers present information in multimedia formats, so students requiring visual support can succeed socially and academically. Read more about how SMART products can assist students through visual support.

SMART Notebook collaborative learning software

SMART Notebook software helps you create flexible lessons that are vivid and media-rich. It provides a variety of tools for customizing whichever text and images work best for your students. You can use SMART Notebook to

- Make content highly visible by enlarging, highlighting, spotlighting and circling text and images and by using the dual-page display
- Supplement verbal information with visual information. The Gallery in SMART Notebook includes a wide variety of video clips, colors, sound files, images and graphics, including symbol support.
- Reveal content at an appropriate pace for students to process information and reduce distractions on a page by using the *Screen Shade* feature
- Create graphic organizers that help build knowledge. For example, you can use the line drawing tool to help students follow a clear visual path.
- Help students who are photosensitive or colorblind by adjusting color schemes
- Reduce glare and enhance contrast by selecting specific color combinations
- Make content easier for students to see by downloading SMART Notebook files onto their individual computers
- Incorporate assistive technologies, such as symbol libraries, into your lessons. Libraries can be added to the Gallery in SMART Notebook or copied and pasted from another application, providing yet another rich source of visual support for teaching complex words and concepts.

SMART Board interactive whiteboard

Because of its large, touch-enabled surface, the SMART Board interactive whiteboard makes it easier for students with visual requirements to interact with content. Using intuitive touch gestures, teachers and students can enlarge images and text. Teachers can also sharpen contrast and promote visual tracking on the screen. The SMART Board interactive whiteboard also facilitates inclusive learning environments because students with different learning styles can work together anywhere on the surface without being restricted to a defined space or required to use a specific tool.

SMART Response interactive response systems

SMART Response interactive response systems include powerful assessment software and wireless remotes (or clickers). SMART Response offers an intuitive and accessible means for students to respond to questions, so they can stay involved in lessons. SMART Response makes it easy for students with visual requirements to

- Ensure formative or ad hoc questions are posed to students visually, not just verbally
- Provide immediate visual feedback, so students know right away if they've understood lesson material
- Answer questions using SMART Response LE by feeling and seeing the remote's large, raised, colorful buttons and simple symbols
- View questions on their own computers using SMART Response CE or VE. Text can then be enlarged for better visibility.

SMART Table interactive learning center

The SMART Table interactive learning center provides a multitouch, multiuser experience that's ideal for inclusive classrooms because students can approach material in a variety of ways. And, SMART Table is so intuitive to use, students can complete many activities without verbal instructions. You can use SMART Table to

- Offer students a horizontal, interactive learning surface that provides clear visual cues
- Customize information with text, audio and video clips, and graphics, including symbol support
- Meet individual student needs by customizing SMART Table activities
- Provide individualized learning experiences by designing lessons with different pictures or font sizes for students working on different quadrants of SMART Table. You can also change the background color and font color or enlarge text and images.
- Incorporate assistive technologies, such as symbol-based software. Symbols can be easily imported into most applications for SMART Table, providing students with alternate ways to interact with content.

SMART Document Camera

SMART Document Camera is designed to project enlarged images of an object, so it's an excellent tool for students requiring visual support. You can use SMART Document Camera to

- Make demonstrations or instructions easy for everyone to see
- Show the entire class magnified images when it's used in combination with a microscope
- Create hands-on learning activities where students use flash cards to trace letters, words and shapes, and then enlarge them with SMART Document Camera
- Show 3D images that enhance lessons. When students hold a mixed reality cube under SMART Document Camera, a 3D image is displayed on the interactive whiteboard, making lessons even more visual.

SMART Sync classroom management software

SMART Sync classroom management software connects your computer with those of your students, making it easy to deliver materials in a variety of formats. You can use SMART Sync to

- Show lessons on the SMART Board interactive whiteboard and on students' individual computers or devices, so they aren't struggling to read content at the front of the room
- Enable students to use assistive technologies, such as text-enlarging software
- Promote student participation by providing instructions in a textual format
